≠ Current Rating vs. Capacitance

3838C/P Current Rating vs Capacitance

The current depends
on voltage limited:

$$I = \frac{\sqrt{2}}{2} I_{\text{peak}} = \frac{\sqrt{2}}{2} \times \frac{V_{\text{rated}}}{X_C} = \sqrt{2\pi f C V_{\text{rated}}}$$

The current depends on
power dissipation limited:

$$I = \sqrt{\frac{P_{\text{dissipation}}}{\text{ESR}}}$$

Note: If the thermal resistance of mounting surface is 12°C/W, then a power dissipation of 5W will result in the current limited. We can calculate the current limited.

≠ Custom Assemblies

Passive Plus offers Capacitor Assemblies for high power requirements. Typical assemblies are configured in series and/or parallel combinations, producing higher voltage/current handling capabilities, extended capacitance range and tighter tolerances.

To get started, simply send us either a mechanical drawing or circuit conditions and we can recommend a solution. All components are 100% up-screened for Partial Discharge and Sonoscanned. All assemblies include a 100hr Military burn in.

⚡ Recommended Land Pattern Dimensions

When mounting the capacitor to substrate, it's important to carefully consider that the amount of solder (size of fillet) used has a direct effect upon the capacitor once it's mounted.

- 1) The greater the amount of solder, the greater the stress to the elements. This may cause the substrate to break or crack.
- 2) In the situation where two or more devices are mounted onto a common land, be sure to separate the device into exclusive pads by using soldering resist.

- Determined by component size. Typical clearance between the cavity and the component is:
.05 (.002) min to .50 (.020) max for 8mm tape and .50 (.002) min to .65 (.026) max for 12mm tape.
- The component cannot rotate more than 20° within the determined cavity.
